    mealType: "Breakfast"
    name: "Cake"
    steps: "shaped like fish"

What we used

What We Didn't Know (But Learned)

- Little web dev experience
- No back-end knowledge (no databases for recipes)
  - Firebase to store database as JSON
  - Never used JSON before, but why not start now?!
  - Never used Javascript either, for that matter
- HTML & CSS in under 12 hours
- Set up a web host that pulls pages from github
  - Web development with version control!
  - Using PuTTY to link a virtual machine to a domain name

What We'd Continue/Do Different

- No security to form/Firebase setup as-is
- JS for form input validation
- Addition form input improvements
- Read back from JSON to Recipe page
- Don't panic and push last minute changes to the master branch
